

Hospitaline isn't just a simple system to manage doctor-patient interactions, we have built it with a bigger purpose in mind. It not only manages appointments or records, its designed to improve how nowadays healthcare works for both patients and doctors.

HOSPITALINE SYSTEM INTENTS

The primary intent of our application is to create a user-friendly digital platform that not only increases the efficiency but also the accessibility of healthcare services. Hospitaline is designed to centralize and streamline the hospital workflow focusing in 3 big challenges that hospital face nowadays:

1. The appointment scheduling.
2. The medical record organization.
3. The medicine supply management and coordination.

In addition, we want to reduce the amount of time doctors and staff spend dealing with this messy systems so that they can focus more on what really matters: **the patient**.

OUR KEY OBJECTIVES:

1. APPOINTMENT SCHEDULING

We wanted to make the whole process of scheduling, rescheduling and cancelling appointments as simple and smooth as possible for both users: doctors and patients. Now this process is messy, slow or it just simply doesn't work.

With Hospitaline patients can easily choose the time that works best for them and book appointments with the doctor that they want without having to call or wait. If something changes, they can reschedule or cancel in just a few clicks.

On the other side, doctors get a clear view of their next appointments without having to deal with last-minute surprises. It helps them to spend more time on their patients instead of managing schedules.

2. MEDICAL RECORD SYSTEM

Right now, in many hospitals the medical records are a mess: sometimes in paper others in confusing systems but never easy to find when they are needed. This not only slows things down but also affect how patients are treated.

With Hospitaline, doctors can update and check the patient full medical history in just a seconds. Medical records include their diagnosis, treatment and the medicine prescribed to them. All in one place, secure and always up to date. Patients also get to access their own records in a clean format, without guessing what a report means.

3. MEDICINE SUPPLY COORDINATION

Keeping the stock of the medicine supply of a hospital may look like a simple task to do but it is a constant challenge for hospitals. Staff waste a lot of time looking for what they need and when this is not well organized the patient is who suffer it.

This is why Hospitaline focuses on organizing the medicine supply system in a simple platform where doctors can track every medicine in real time stock. Each medicine is labelled with its name and the amount, and then this can be prescribed to the patient through the medical records.

LIST OF FEATURES:

- Easy rescheduling and cancellation of appointments.
- Access to past diagnoses, treatments and prescriptions from the medical records.
- Patient view of their own medical record.
- Tracking of whether a medicine is available or not.
- Appointment scheduling easy to choose the doctor and the time.
